Memory FRAM

256 K (32 K × 8) Bit I²C

MB85RC256V

■ DESCRIPTION

The MB85RC256V is an FRAM (Ferroelectric Random Access Memory) chip in a configuration of 32,768 words × 8 bits, using the ferroelectric process and silicon gate CMOS process technologies for forming the nonvolatile memory cells.

Unlike SRAM, the MB85RC256V is able to retain data without using a data backup battery.

The read/write endurance of the nonvolatile memory cells used for the MB85RC256V has improved to be at least 10^{12} cycles, significantly outperforming other nonvolatile memory products in the number.

The MB85RC256V does not need a polling sequence after writing to the memory such as the case of Flash memory or E²PROM.

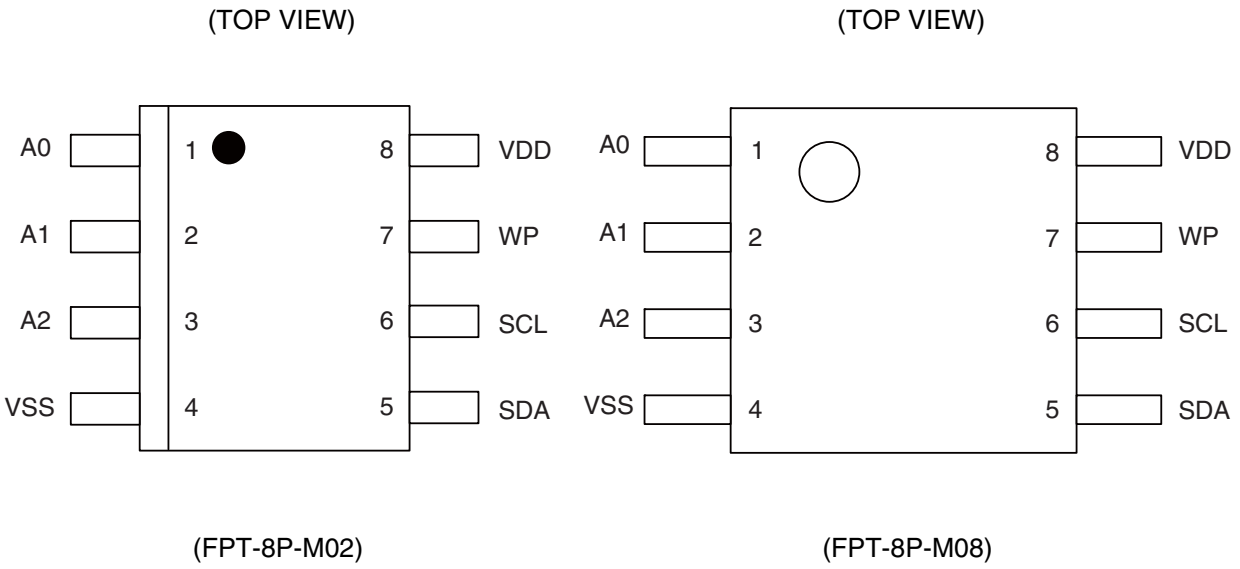
■ FEATURES

- Bit configuration : 32,768 words × 8 bits
- Two-wire serial interface : Fully controllable by two ports: serial clock (SCL) and serial data (SDA).
- Operating frequency : 2.7V to 4.5V 400 kHz (Max)
  4.5V to 5.5V 1 MHz (Max)
- Read/write endurance : 10^{12} times / byte
- Data retention : 10 years (+ 85 °C)
- Operating power supply voltage : 2.7 V to 5.5 V
- Low-power consumption : Operating power supply current 250 µA (Max @1 MHz)
  Standby current 27 µA (Typ)
- Operation ambient temperature range
  : − 40 °C to + 85 °C
- Package : 8-pin plastic SOP (FPT-8P-M02)
  8-pin plastic SOP (FPT-8P-M08)
  Both are RoHS compliant

2012.9

FUJITSU

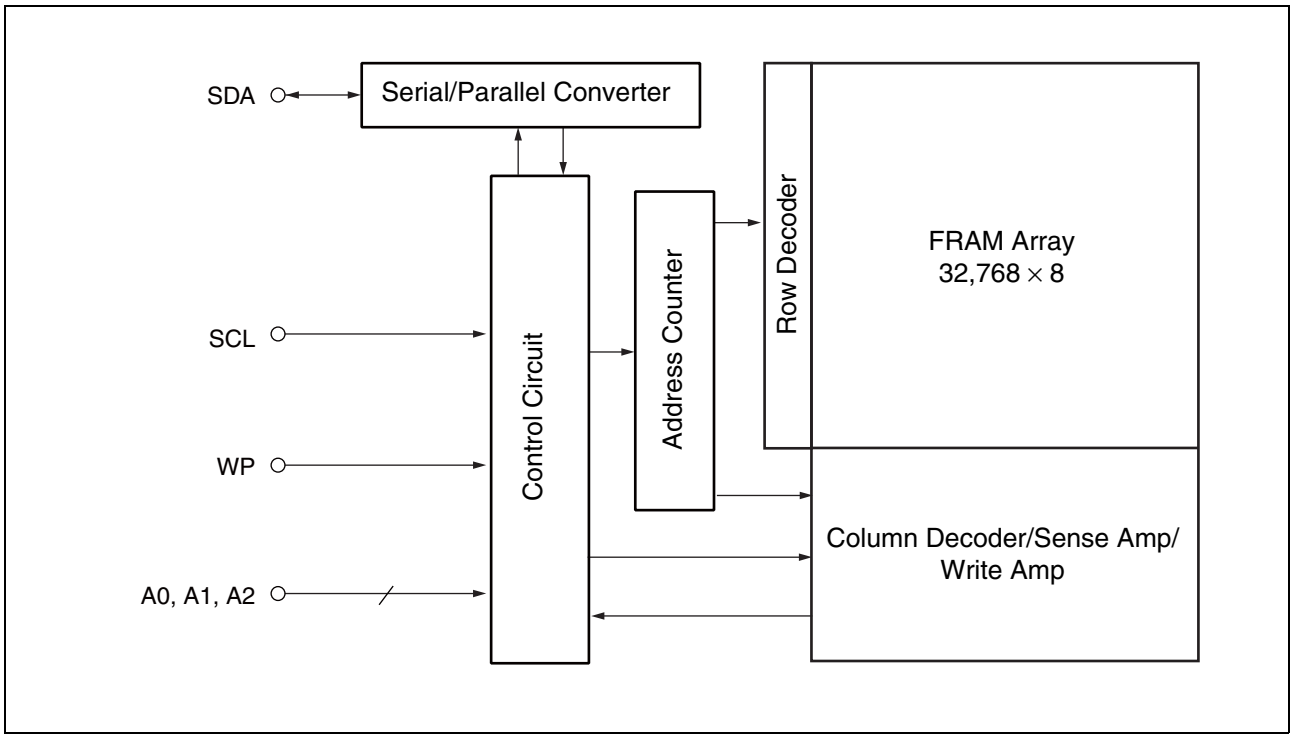
■ PIN ASSIGNMENT



■ PIN FUNCTIONAL DESCRIPTIONS

Pin Number	Pin Name	Functional Description
1 to 3	A0 to A2	Device Address pins The MB85RC256V can be connected to the same data bus up to 8 devices. Device addresses are used in order to identify each of these devices. Connect these pins to VDD pin or VSS pin externally. Only if the combination of VDD and VSS pins matches Device Address Code inputted from the SDA pin, the device operates. In the open pin state, A0, A1, and A2 pins are internally pulled-down and recognized as the "L" level.
4	VSS	Ground pin
5	SDA	Serial Data I/O pin This is an I/O pin which performs bidirectional communication for both memory address and writing/reading data. It is possible to connect multiple devices. It is an open drain output, so a pull-up resistor is required to be connected to the external circuit.
6	SCL	Serial Clock pin This is a clock input pin for input/output timing serial data. Data is sampled on the rising edge of the clock and output on the falling edge.
7	WP	Write Protect pin When the Write Protect pin is the “H” level, the writing operation is disabled. When the Write Protect pin is the “L” level, the entire memory region can be overwritten. The reading operation is always enabled regardless of the Write Protect pin input level. The write protect pin is internally pulled down to VSS pin, and that is recognized as the “L” level (write enabled) when the pin is the open state.
8	VDD	Supply Voltage pin

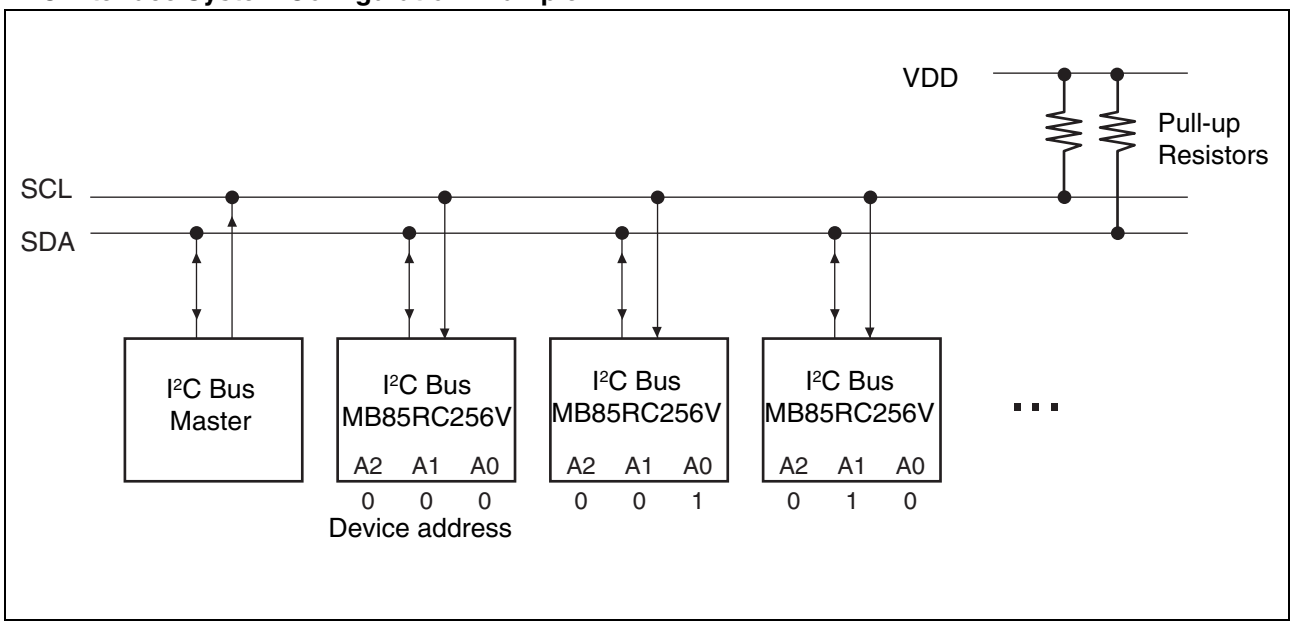
■ BLOCK DIAGRAM



■ I²C (Inter-Integrated Circuit)

The MB85RC256V has the two-wire serial interface; the I²C bus,and operates as a slave device.
The I²C bus defines communication roles of “master” and “slave” devices, with the master side holding the authority to initiate control. Furthermore, the I²C bus connection is possible where a single master device is connected to multiple slave devices in a party-line configuration. In this case, it is necessary to assign a unique device address to the slave device, the master side starts communication after specifying the slave to communicate by addresses.

• I²C Interface System Configuration Example



■ I²C COMMUNICATION PROTOCOL

The I²C bus is a two wire serial interface that uses a bidirectional data bus (SDA) and serial clock (SCL). A data transfer can only be initiated by the master, which will also provide the serial clock for synchronization. The SDA signal should change while SCL is the “L” level. However, as an exception, when starting and stopping communication sequence, SDA is allowed to change while SCL is the “H” level.

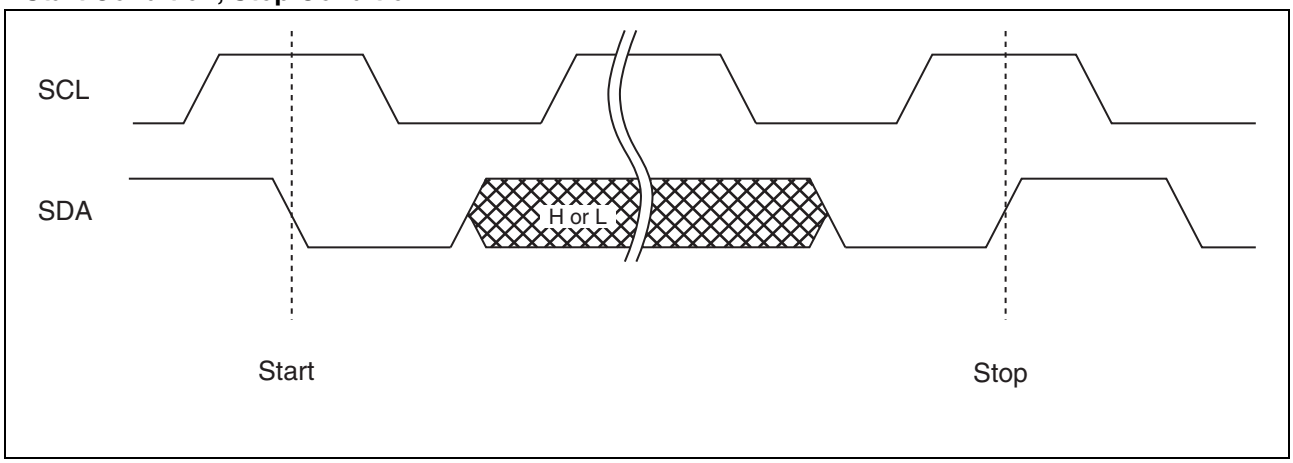
- Start Condition

To start read or write operations by the I²C bus, change the SDA input from the “H” level to the “L” level while the SCL input is in the “H” level.

- Stop Condition

To stop the I²C bus communication, change the SDA input from the “L” level to the “H” level while the SCL input is in the “H” level. In the reading operation, inputting the stop condition finishes reading and enters the standby state. In the writing operation, inputting the stop condition finishes inputting the rewrite data and enters the standby state.

• Start Condition, Stop Condition



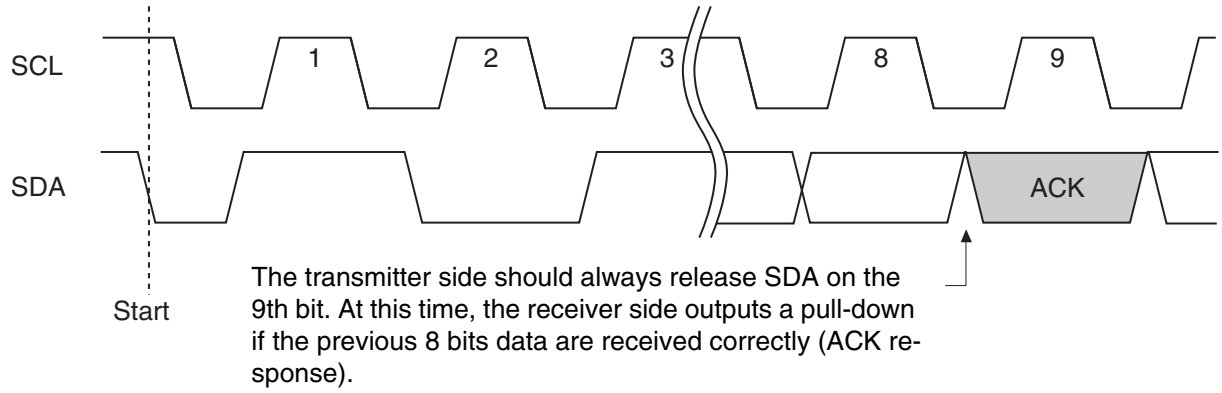
Note : At the write operation, the FRAM device does not need the programming wait time (t_{WC}) after issuing the Stop Condition.

■ ACKNOWLEDGE (ACK)

In the I²C bus, serial data including address or memory information is sent in units of 8 bits. The acknowledge signal indicates that every 8 bits of the data is successfully sent and received. The receiver side usually outputs the “L” level every time on the 9th SCL clock after each 8 bits are successfully transmitted and received. On the transmitter side, the bus is temporarily released to Hi-Z every time on this 9th clock to allow the acknowledge signal to be received and checked. During this Hi-Z released period, the receiver side pulls the SDA line down to indicate the “L” level that the previous 8 bits communication is successfully received.

In case the slave side receives Stop condition before sending or receiving the ACK “L” level, the slave side stops the operation and enters to the standby state. On the other hand, the slave side releases the bus state after sending or receiving the NACK “H” level. The master side generates Stop condition or Start condition in this released bus state.

• Acknowledge timing overview diagram



■ DEVICE ADDRESS WORD (Slave address)

Following the start condition, the master inputs the 8 bits device address word to start I²C communication. The device address word (8 bits) consists of a device Type code (4 bits), device address code (3 bits), and a read/write code (1 bit).

- Device Type Code (4 bits)

The upper 4 bits of the device address word are a device type code that identifies the device type, and are fixed at “1010” for the MB85RC256V.

- Device Address Code (3 bits)

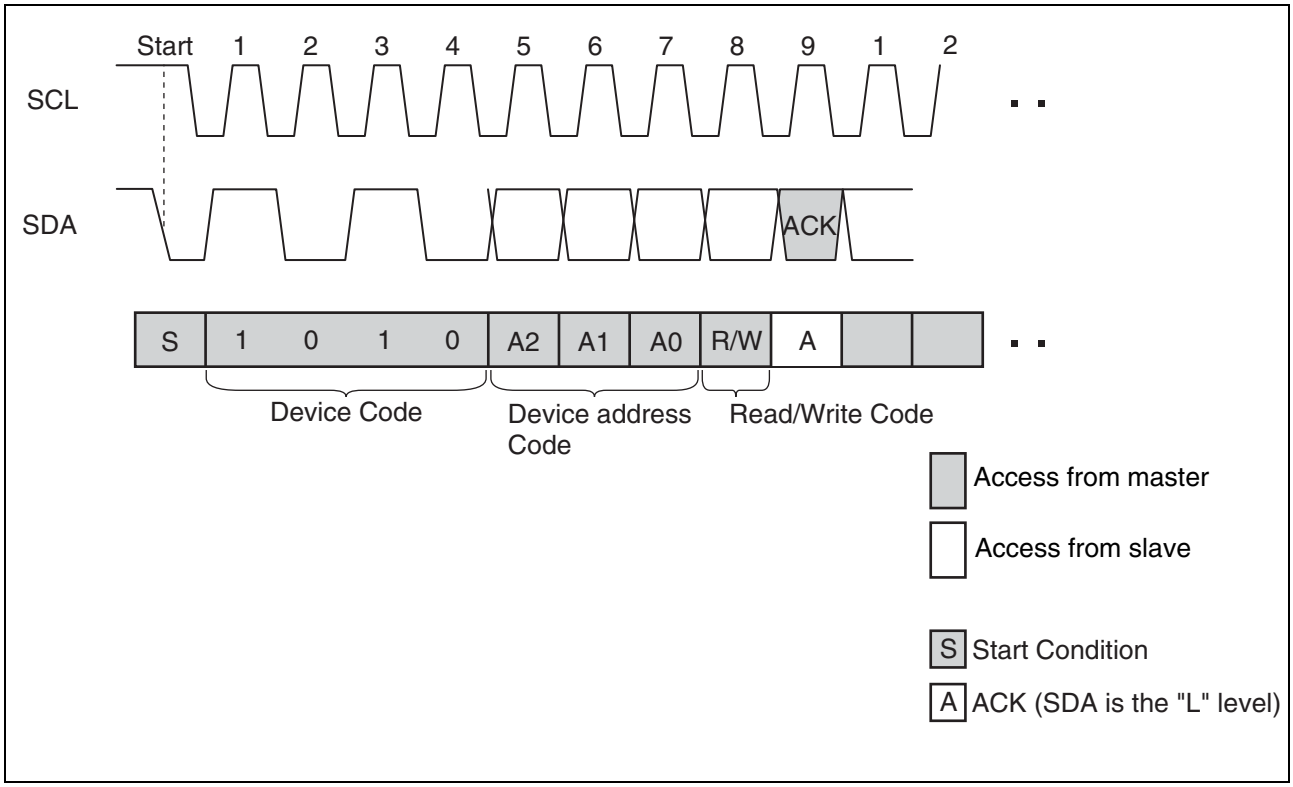
Following the device type code, the 3 bits of the device address code are input in order of A2, A1, and A0. The device address code identifies one device from up to eight devices connected to the bus.
Each MB85RC256V is given a unique 3 bits code on the device address pin (external hardware pin A2, A1, and A0). The slave only responds if the received device address code is equal to this unique 3 bits code.

- Read/Write Code (1 bit)

The 8th bit of the device address word is the R/W (read/write) code. When the R/W code is “0”, a write operation is enabled, and the R/W code is “1”, a read operation is enabled for the MB85RC256V.

It turns to a stand-by state if the device code is not “1010” or device address code does not equal to pins A2, A1, and A0.

• Device Address Word



■ DATA STRUCTURE

In the I²C bus, the acknowledge “L” level is output on the 9th bit by a slave, after the 8 bits of the device address word following the start condition are input by a master. After confirming the acknowledge response by the master, the master outputs 8 bits × 2 memory address to the slave. When the each memory address input ends, the slave again outputs the acknowledge “L” level. After this operation, the I/O data follows in units of 8 bits, with the acknowledge “L” level output after every 8 bits.

It is determined by the R/W code whether the data line is driven by the master or the slave. However, the clock line shall be driven by the master. For a write operation, the slave will accept 8 bits from the master, then send an acknowledge. If the master detects the acknowledge, the master will transfer the next 8 bits. For a read operation, the slave will place 8 bits on the data line, then wait for an acknowledge from the master.

■ FRAM ACKNOWLEDGE -- POLLING NOT REQUIRED

The MB85RC256V performs the high speed write operations, so any waiting time for an ACK polling* does not occur.

*: In E²PROM, the Acknowledge Polling is performed as a progress check whether rewriting is executed or not. It is normal to judge by the 9th bit of Acknowledge whether rewriting is performed or not after inputting the start condition and then the device address word (8 bits) during rewriting.

■ WRITE PROTECT (WP)

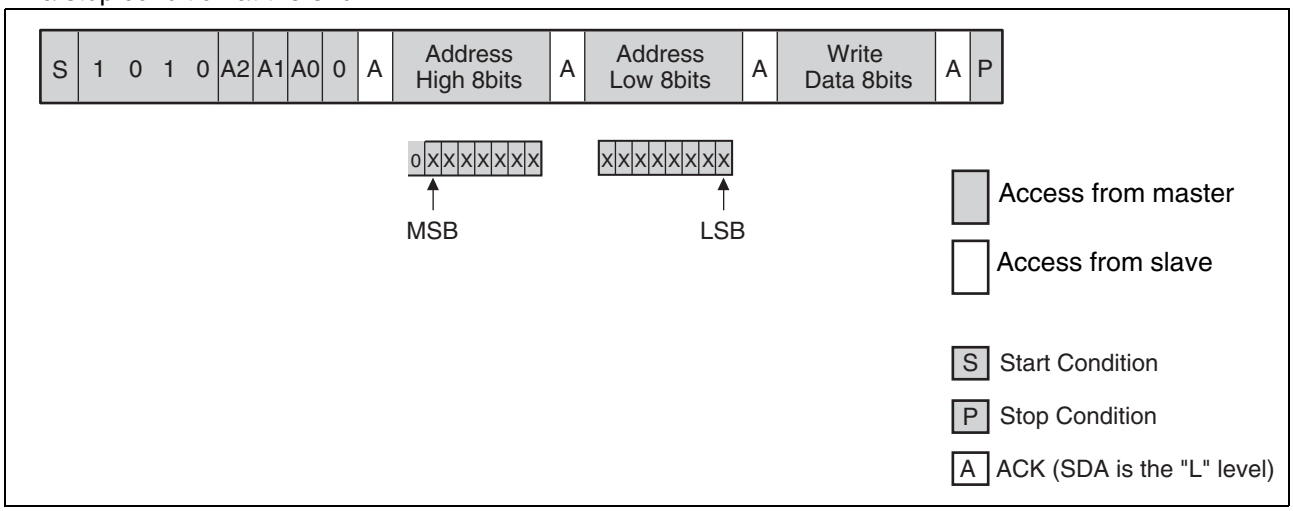
The entire memory array can be write protected using the Write Protect pin. When the Write Protect pin is set to the “H” level, the entire memory array will be write protected. When the Write Protect pin is the “L” level, the entire memory array will be rewritten. Reading is allowed regardless of the WP pin's “H” level or “L” level.

Note : The Write Protect pin is pulled down internally to the VSS pin, therefore if the Write Protect pin is open, the pin status is detected as the “L” level (write enabled).

■ COMMAND

• Byte Write

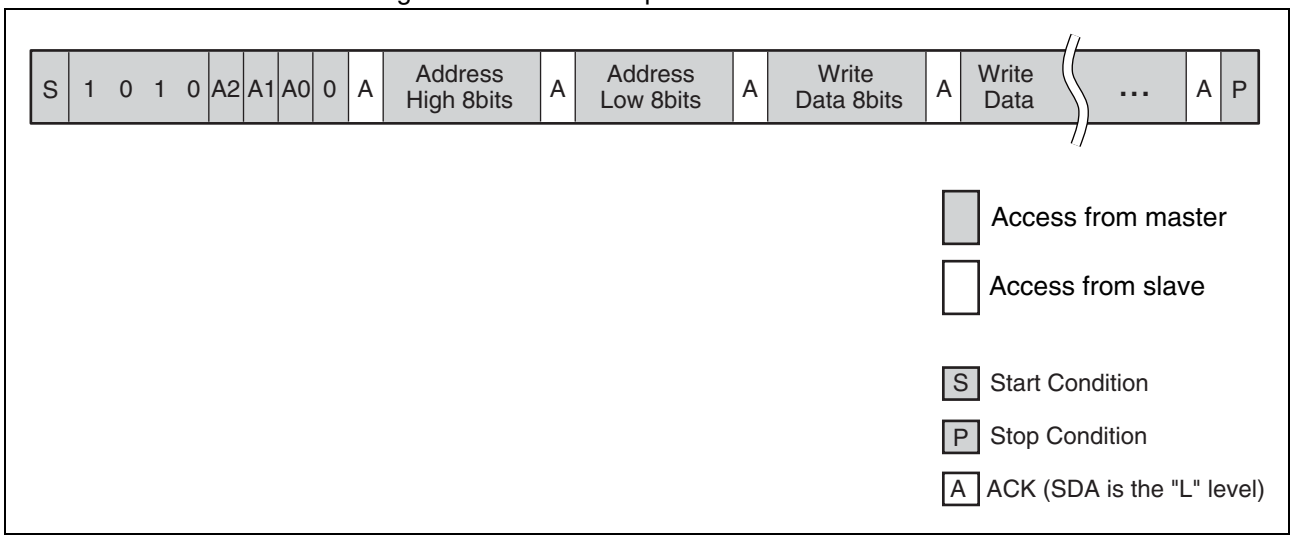
If the device address word (R/W “0” input) is sent following the start condition, the slave responds with an ACK. After this ACK, write addresses and data are sent in the same way, and the write ends by generating a stop condition at the end.



Note : In the MB85RC256V, input “0” to the most significant bit of the higher address byte because the address is expressed with 15 bits.

• Page Write

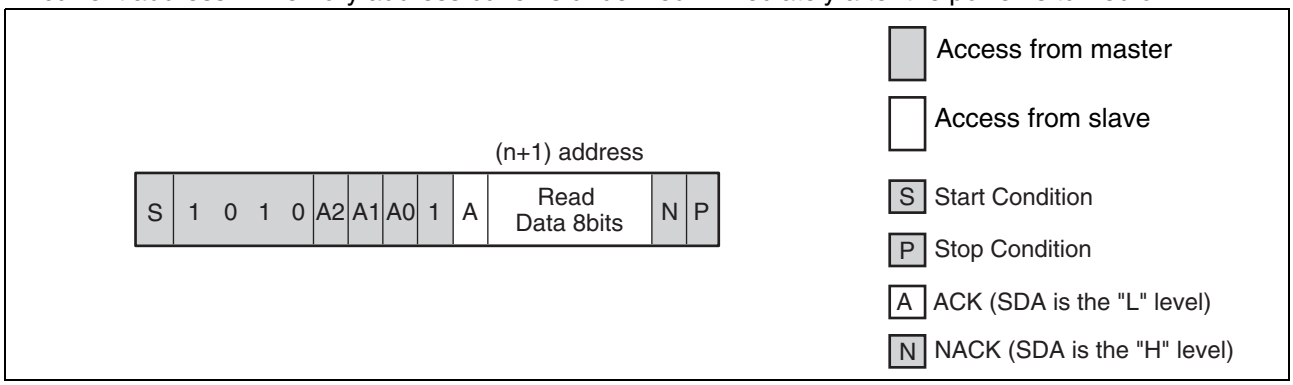
If additional 8 bits are continuously sent after the same command (except stop condition) as Byte Write, a page write is performed. The memory address rolls over to first memory address (0000_H) at the end of the address. Therefore, if more than 32 Kbytes are sent, the data is overwritten in order starting from the start of the memory address that was written first. Because FRAM performs the high-speed write operations, the data will be written to FRAM right after the ACK response finished.



Note : It is not necessary to take a period for internal write operation cycles from the buffer to the memory after the stop condition is generated.

• Current Address Read

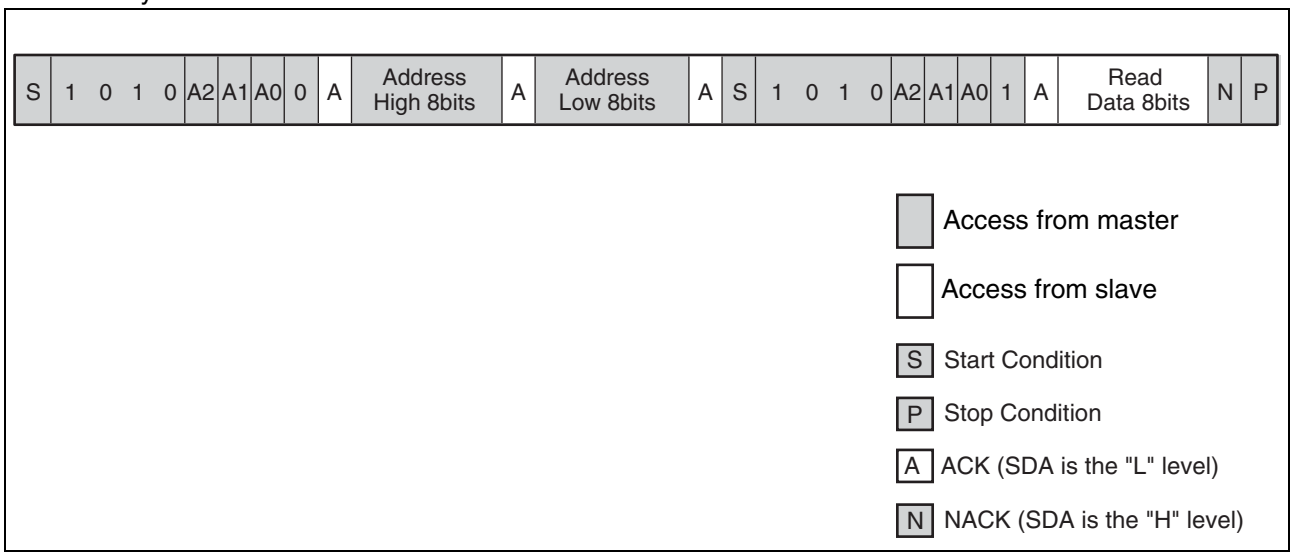
When the previous write or read operation finishes successfully up to the stop condition and assumes the last accessed address is “n”, then the address at “n+1” is read by sending the following command unless turning the power off. If the memory address is last address, the address counter will roll over to 0000_H. The current address in memory address buffer is undefined immediately after the power is turned on.



• Random Read

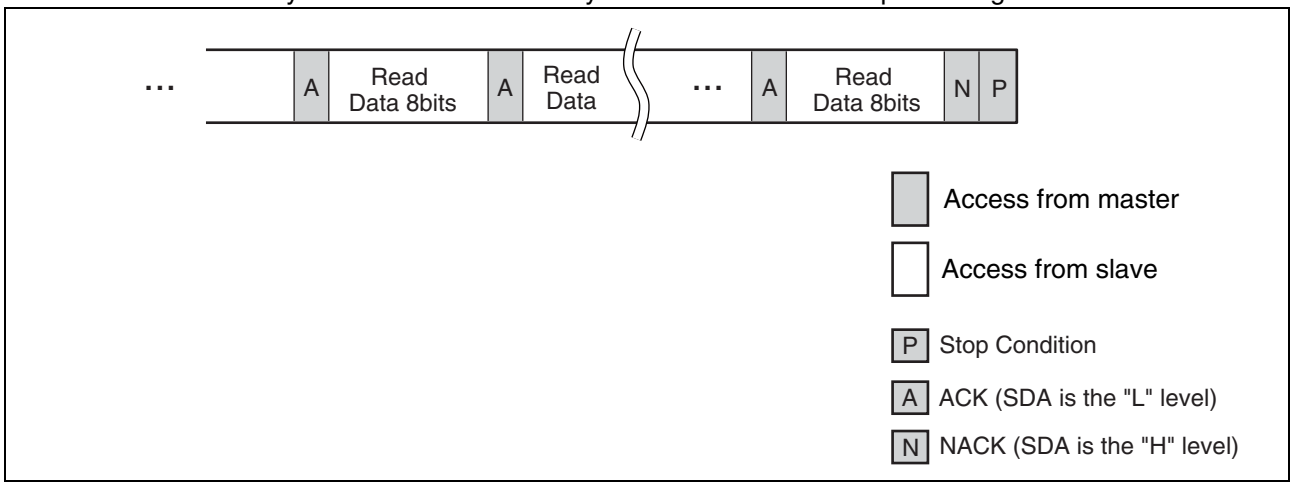
The one byte of data from the memory address saved in the memory address buffer can be read out synchronously to SCL by specifying the address in the same way as for a write, and then issuing another start condition and sending the Device Address Word (R/W “1” input).

The final NACK (SDA is the "H" level) is issued by the receiver that receives the data. In this case, this bit is issued by the master side.



• Sequential Read

Data can be received continuously following the Device address word (R/W “1” input) after specifying the address in the same way as for Random Read. If the read reaches the end of address, the internal read address automatically rolls over to first memory address 0000_H and keeps reading.



• Device ID

The Device ID command reads fixed Device ID. The size of Device ID is 3 bytes and consists of manufacturer ID and product ID. The Device ID is read-only and can be read out by following sequences.

a) The master sends the Reserved Slave ID $F8_H$ after the START condition.

b) The master sends the device address word after the ACK response from the slave.
In this device address word, R/W code are “Don't care” value.

c) The master re-sends the START condition followed by the Reserved Slave ID $F9_H$ after the ACK response from the slave.

d) The master read out the Device ID succeedingly in order of Data Byte 1st / 2nd / 3rd after the ACK response from the slave.

e) The master respnds the NACK (SDA is the “H” level) after reading 3 bytes of the Device ID.
In case the master respond the ACK after reading 3 bytes of the Device ID, the master re-reading the Device ID from the 1st byte.

Access from master
Access from slave
S Start Condition
P Stop Condition
A ACK (SDA is the "L" level)
N NACK (SDA is the "H" level)

Data Byte 1st								Data Byte 2nd				Data Byte 3rd									
Manufacture ID = $00A_H$												Product ID = 510_H									
11	10	9	8	7	6	5	4	3	2	1	0	11	10	9	8	7	6	5	4	3	2	1	0
Fujitsu Semiconductor												Density = 5_H				Proprietary use							
0	0	0	0	0	0	0	0	1	0	1	0	0	1	0	1	0	0	0	1	0	0	0	0

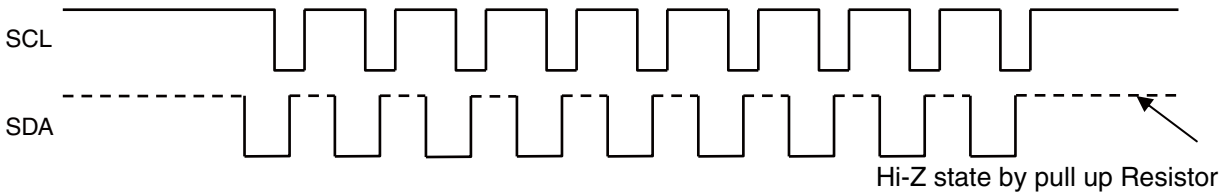
■ SOFTWARE RESET SEQUENCE OR COMMAND RETRY

In case the malfunction has occurred after power on, the master side stopped the I²C communication during processing, or unexpected malfunction has occurred, execute the following (1) software recovery sequence just before each command, or (2) retry command just after failure of each command.

(1) Software Reset Sequence

Since the slave side may be outputting “L” level, do not force to drive “H” level, when the master side drives the SDA port. This is for preventing a bus conflict. The additional hardware is not necessary for this software reset sequence.

9 set of “Start Conditions and one “1” data”



Send “Start Condition and one data “1”” .
Repeat these 9 times just before Write or Read command.

(2) Command Retry

Command retry is useful to recover from failure response during I²C communication.

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Rating		Unit
		Min	Max	
Power supply voltage*	V_{DD}	− 0.5	+6.0	V
Input voltage*	V_{IN}	− 0.5	V_{DD} + 0.5 (≤ 6.0)	V
Output voltage*	V_{OUT}	− 0.5	V_{DD} + 0.5 (≤ 6.0)	V
Operation ambient temperature	T_A	− 40	+ 85	°C
Storage temperature	Tstg	− 40	+ 125	°C

*: These parameters are based on the condition that VSS is 0 V.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Value			Unit
		Min	Typ	Max	
Power supply voltage*	V_{DD}	2.7	—	5.5	V
“H” level input voltage*	V_{IH}	$V_{DD} \times 0.8$	—	5.5	V
“L” level input voltage*	V_{IL}	V_{SS}	—	$V_{DD} \times 0.2$	V
Operation ambient temperature	T_A	− 40	—	+ 85	°C

*: These parameters are based on the condition that VSS is 0 V.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

■ ELECTRICAL CHARACTERISTICS

1. DC Characteristics

(within recommended operating conditions)

Parameter	Symbol	Condition	Value			Unit
			Min	Typ	Max	
Input leakage current*1	$\|I_{LI}\|$	V_{IN} = 0 V to V_{DD}	—	—	1	µA
Output leakage current*2	$\|I_{LO}\|$	V_{OUT} = 0 V to V_{DD}	—	—	1	µA
Operating power supply current	I_{DD}	SCL = 400 kHz	—	—	170	µA
		SCL = 1000 kHz	—	—	250	µA
Standby current	I_{SB}	SCL, SDA = V_{DD} WP = 0 V or V_{DD} or Open Under Stop Condition	—	27 T_A = + 25 °C	56 T_A = + 85 °C	µA
"L" level output voltage	V_{OL}	I_{OL} = 3 mA	—	—	0.4	V
Input resistance for WP, A0, A1, and A2 pins	R_{IN}	V_{IN} = V_{IL} (Max)	50	—	—	kΩ
		V_{IN} = V_{IH} (Min)	1	—	—	MΩ

*1: Applicable pin: SCL,SDA

*2: Applicable pin: SDA

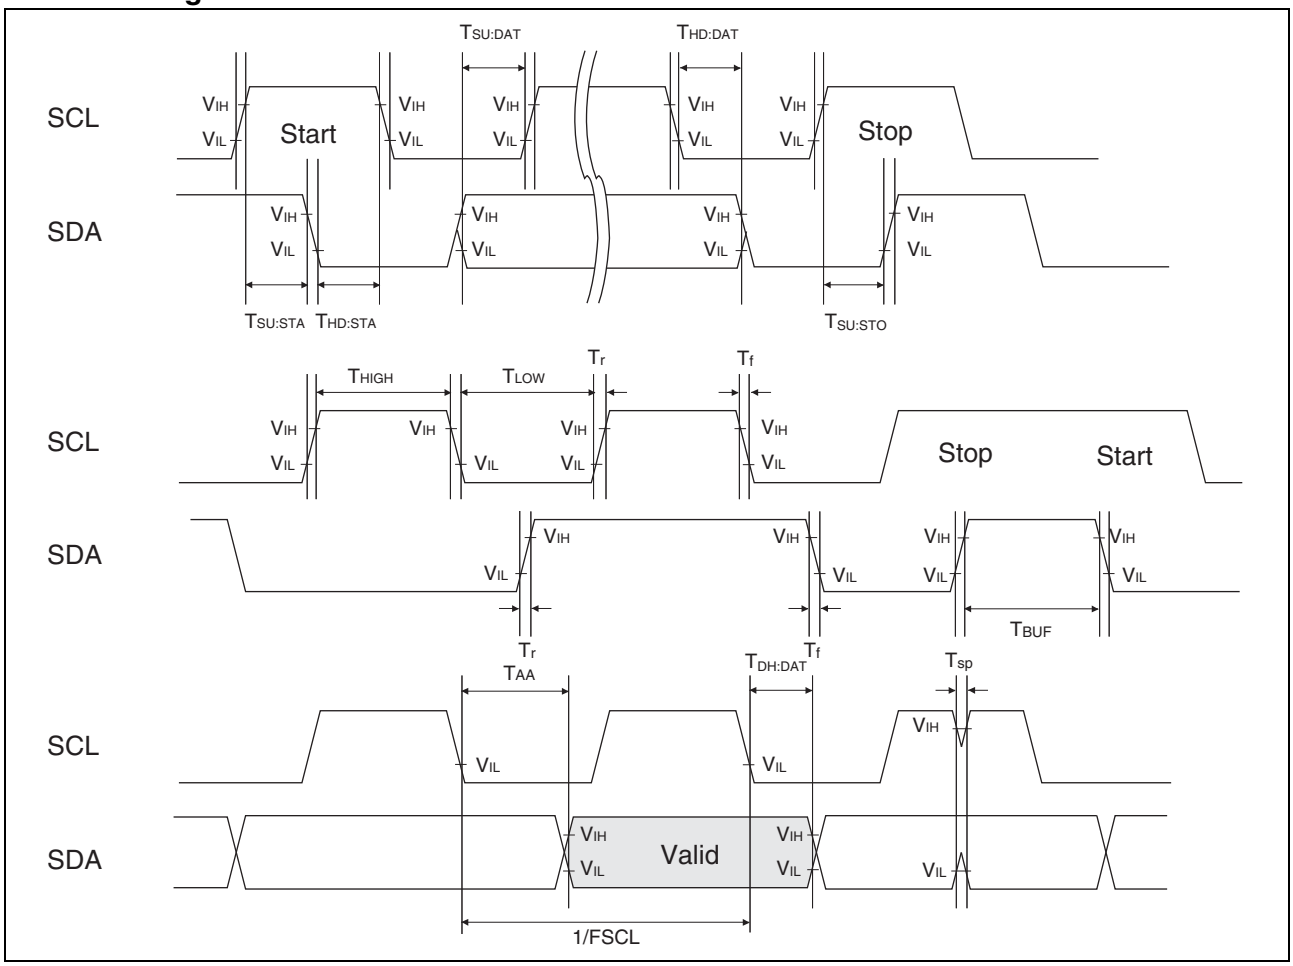
2. AC Characteristics

Parameter	Symbol	Value						Unit
		STANDARD MODE		FAST MODE		FAST MODE PLUS		
		Min	Max	Min	Max	Min	Max	
SCL clock frequency	FSCL	0	100	0	400	0	1000	kHz
Clock high time	T_{HIGH}	4000	—	600	—	400	—	ns
Clock low time	T_{LOW}	4700	—	1300	—	600	—	ns
SCL/SDA rising time	T_r	—	1000	—	300	—	300	ns
SCL/SDA falling time	T_f	—	300	—	300	—	100	ns
Start condition hold	$T_{HD:STA}$	4000	—	600	—	250	—	ns
Start condition setup	$T_{SU:STA}$	4700	—	600	—	250	—	ns
SDA input hold	$T_{HD:DAT}$	0	—	0	—	0	—	ns
SDA input setup	$T_{SU:DAT}$	250	—	100	—	100	—	ns
SDA output hold	$T_{DH:DAT}$	0	—	0	—	0	—	ns
Stop condition setup	$T_{SU:STO}$	4000	—	600	—	250	—	ns
SDA output access after SCL falling	T_{AA}	—	3000	—	900	—	550	ns
Pre-charge time	T_{BUF}	4700	—	1300	—	500	—	ns
Noise suppression time (SCL and SDA)	T_{SP}	—	50	—	50	—	50	ns

AC characteristics were measured under the following measurement conditions.

Power supply voltage : STANDARD MODE and FAST MODE 2.7 V to 5.5 V
: FAST MODE PLUS 4.5 V to 5.5 V
Operation ambient temperature : – 40 °C to + 85 °C
Input voltage magnitude : $V_{DD} \times 0.2$ to $V_{DD} \times 0.8$
Input rising time : 5 ns
Input falling time : 5 ns
Input judge level : $V_{DD}/2$
Output judge level : $V_{DD}/2$

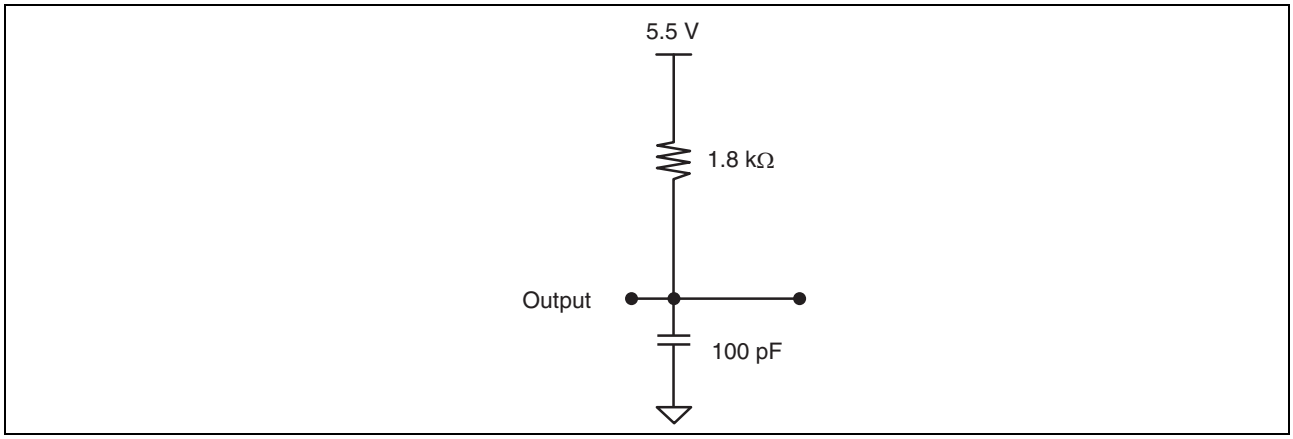
3. AC Timing Definitions



4. Pin Capacitance

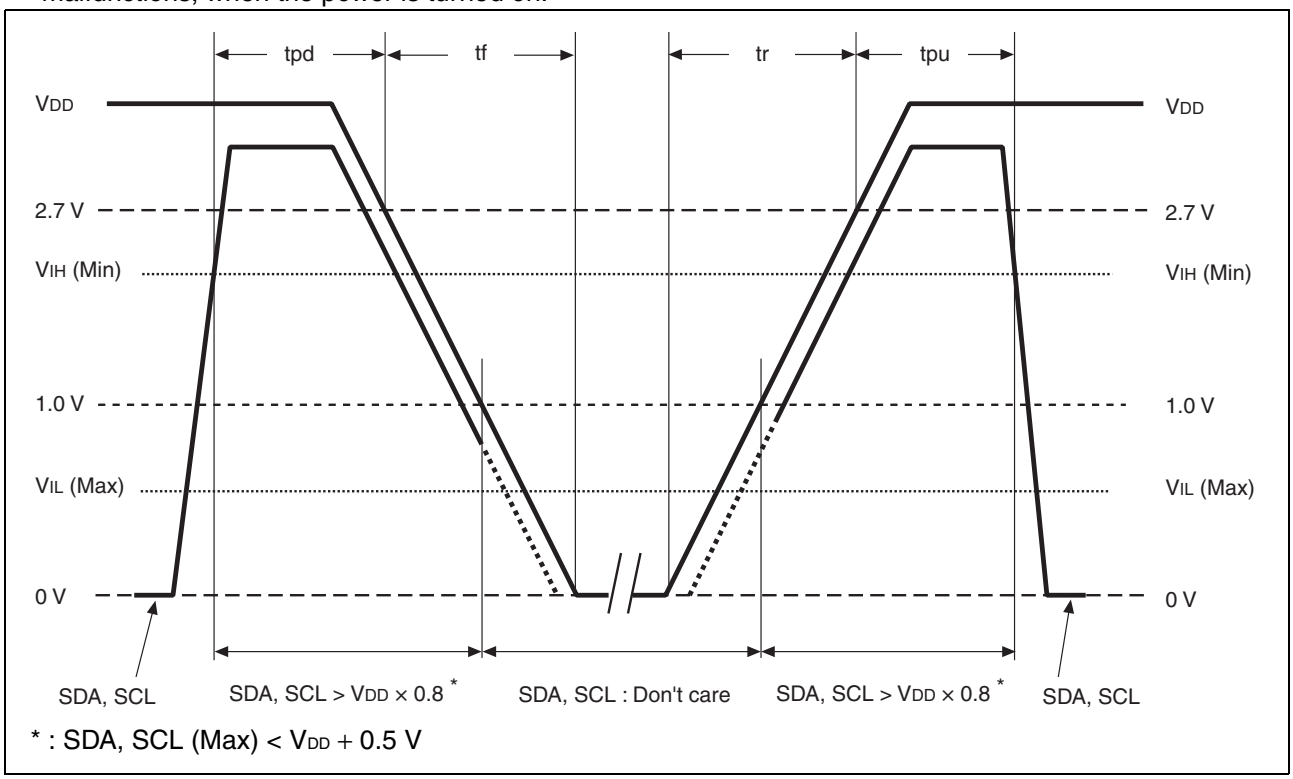
Parameter	Symbol	Conditions	Value			Unit
			Min	Typ	Max	
I/O capacitance	$C_{I/O}$	$V_{DD} = V_{IN} = V_{OUT} = 0$ V, f = 1 MHz, $T_A = +25$ °C	—	—	15	pF
Input capacitance	C_{IN}		—	—	15	pF

5. AC Test Load Circuit



■ POWER ON SEQUENCE

V_{DD} pin is required to be rising from 0 V because turning the power on from an intermediate level may cause malfunctions, when the power is turned on.



* : SDA, SCL (Max) < V_{DD} + 0.5 V

Parameter	Symbol	Value		Unit
		Min	Max	
SDA, SCL level hold time during power down	tpd	85	—	ns
SDA, SCL level hold time during power up	tpu	85	—	ns
Power supply rising time	tr	0.5	50	ms
Power supply falling time	tf	0.5	50	ms

■ FRAM CHARACTERISTICS

Parameter	Value		Unit	Remarks
	Min	Max		
Read/Write Endurance	10^{12}	—	Times/byte	Operation Ambient Temperature T_A = + 85 °C Total numbers of reading and writing
Data Retention	10	—	Years	Operation Ambient Temperature T_A = + 85 °C Retention time of the first reading/writing data right after shipment

Note : Total number of reading and writing defines the minimum value of endurance, as an FRAM memory operates with destructive readout mechanism.

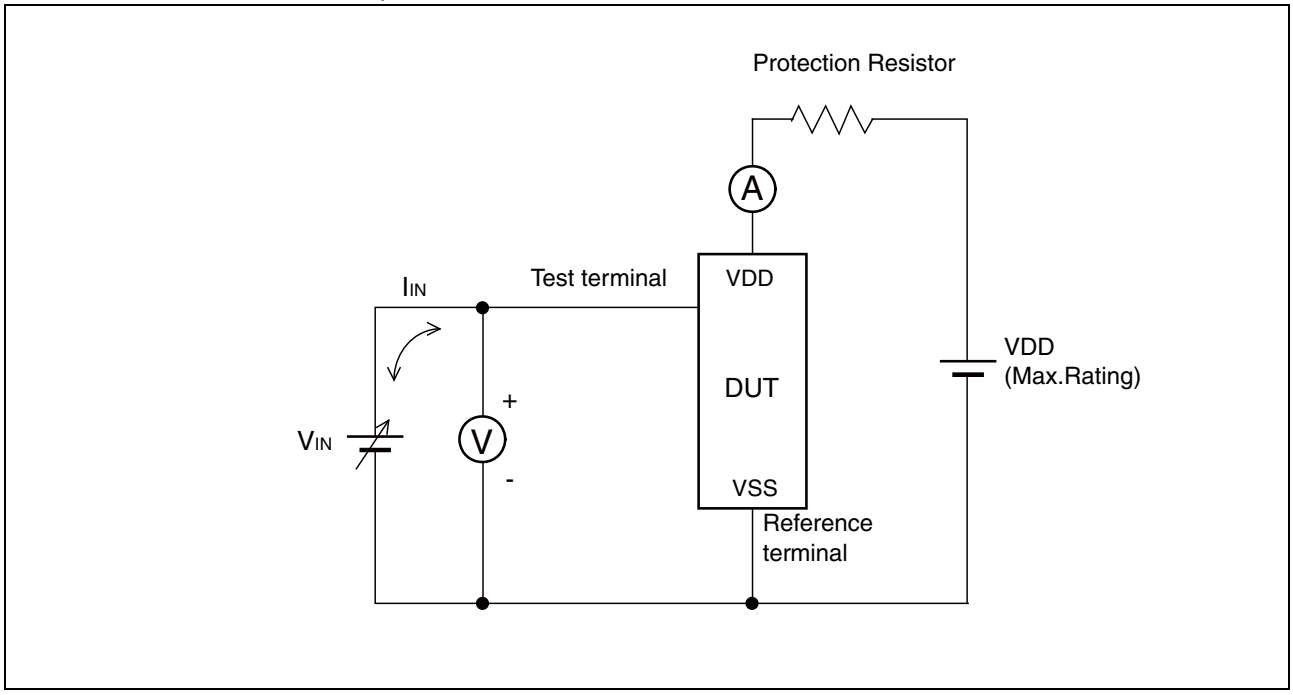
■ NOTE ON USE

- Data written before performing IR reflow is not guaranteed after IR reflow.
- During the access period from the start condition to the stop condition, keep the level of WP, A0, A1, and A2 pins to the “H” level or the “L” level.

■ ESD AND LATCH-UP

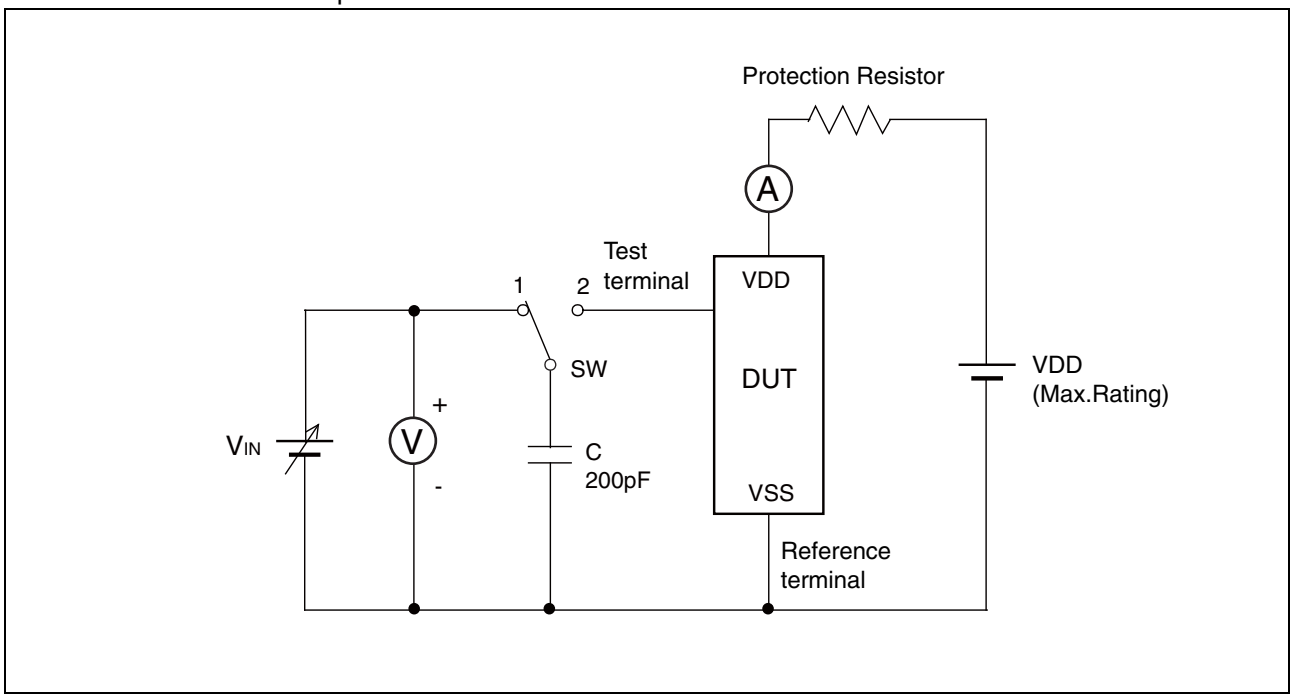
Test	DUT	Value
ESD HBM (Human Body Model) JESD22-A114 compliant	MB85RC256VPNF-G-JNE1	≥ |2000 V|
ESD MM (Machine Model) JESD22-A115 compliant		≥ |200 V|
ESD CDM (Charged Device Model) JESD22-C101 compliant		—
Latch-Up (I-test) JESD78 compliant		—
Latch-Up (V_{supply} overvoltage test) JESD78 compliant		—
Latch-Up (Current Method) Proprietary method		—
Latch-Up (C-V Method) Proprietary method		≥ |200 V|

- Current method of Latch-Up Resistance Test



Note : The voltage V_{IN} is increased gradually and the current I_{IN} of 300 mA at maximum shall flow. Confirm the latch up does not occur under I_{IN} = ± 300 mA.
In case the specific requirement is specified for I/O and I_{IN} cannot be 300 mA, the voltage shall be increased to the level that meets the specific requirement.

• C-V method of Latch-Up Resistance Test

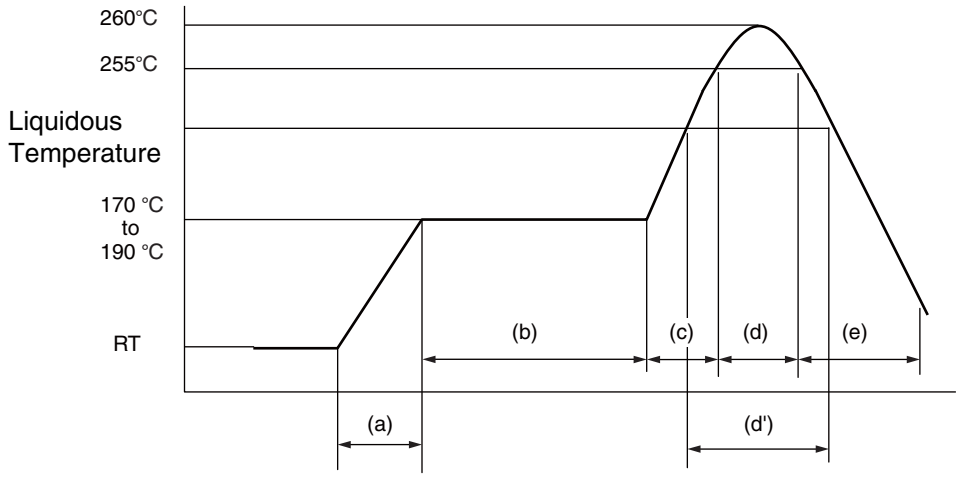


Note : Charge voltage alternately switching 1 and 2 approximately 2 sec interval. This switching process is considered as one cycle.
Repeat this process 5 times. However, if the latch-up condition occurs before completing 5times, this test must be stopped immediately.

■ REFLOW CONDITIONS AND FLOOR LIFE

Item	Condition	
Method	IR (infrared reflow) , Convection	
Times	2	
Floor life	Before unpacking	Please use within 2 years after production.
	From unpacking to 2nd reflow	Within 8 days
	In case over period of floor life	Baking with 125 °C+/-3 °C for 24hrs+2hrs/-0hrs is required. Then please use within 8 days. (Please remember baking is up to 2 times)
Floor life condition	Between 5 °C and 30 °C and also below 70%RH required. (It is preferred lower humidity in the required temp range.)	

Reflow Profile



(a) Average ramp-up rate : 1 °C/s to 4 °C/s
(b) Preheat & Soak : 170 °C to 190 °C, 60 s to 180 s
(c) Average ramp-up rate : 1 °C/s to 4 °C/s
(d) Peak temperature : Temperature 260 °C Max; 255 °C within 10 s
(d') Liquidous temperature : Up to 230 °C within 40 s or
Up to 225 °C within 60 s or
Up to 220 °C within 80 s
(e) Cooling : Natural cooling or forced cooling

Note : Temperature on the top of the package body is measured.

■ RESTRICTED SUBSTANCES

This product complies with the regulations below (Based on current knowledge as of November 2011).

- EU RoHS Directive (2002/95/EC)
- China RoHS (Administration on the Control of Pollution Caused by Electronic Information Products (电子信息产品污染控制管理办法))
- Vietnam RoHS (30/2011/TT-BCT)

Restricted substances in each regulation are as follows.

Substances	Threshold	Contain status*
Lead and its compounds	1,000 ppm	❍
Mercury and its compounds	1,000 ppm	❍
Cadmium and its compounds	100 ppm	❍
Hexavalent chromium compound	1,000 ppm	❍
Polybrominated biphenyls (PBB)	1,000 ppm	❍
Polybrominated diphenyl ethers (PBDE)	1,000 ppm	❍

* : The mark of "❍" shows below a threshold value.

2.4 Taping (ϕ330mm Reel) Dry Pack Packing Specifications

Embossed tapes	Dry pack	
Inner box	
Outer box	

*1: For a product of witch part number is suffixed with “E1”, a “ G Pb ” marks is display to the moisture barrier bag and the inner boxes.

*2: The size of the outer box may be changed depending on the quantity of inner boxes.

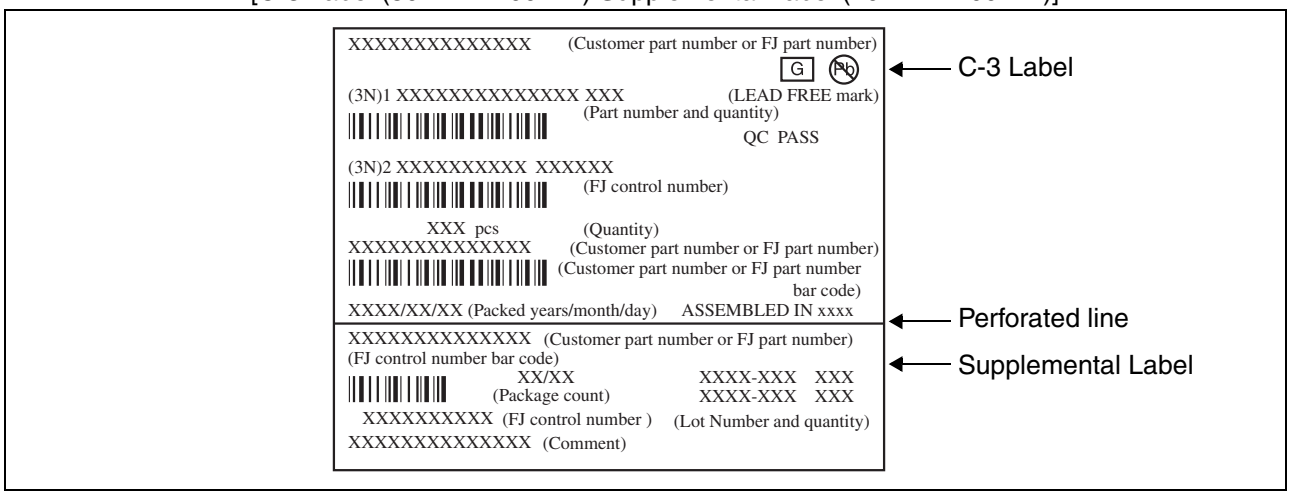
*3: The space in the outer box will be filled with empty inner boxes, or cushions, etc.

*4: Please refer to an attached sheet about the indication label.

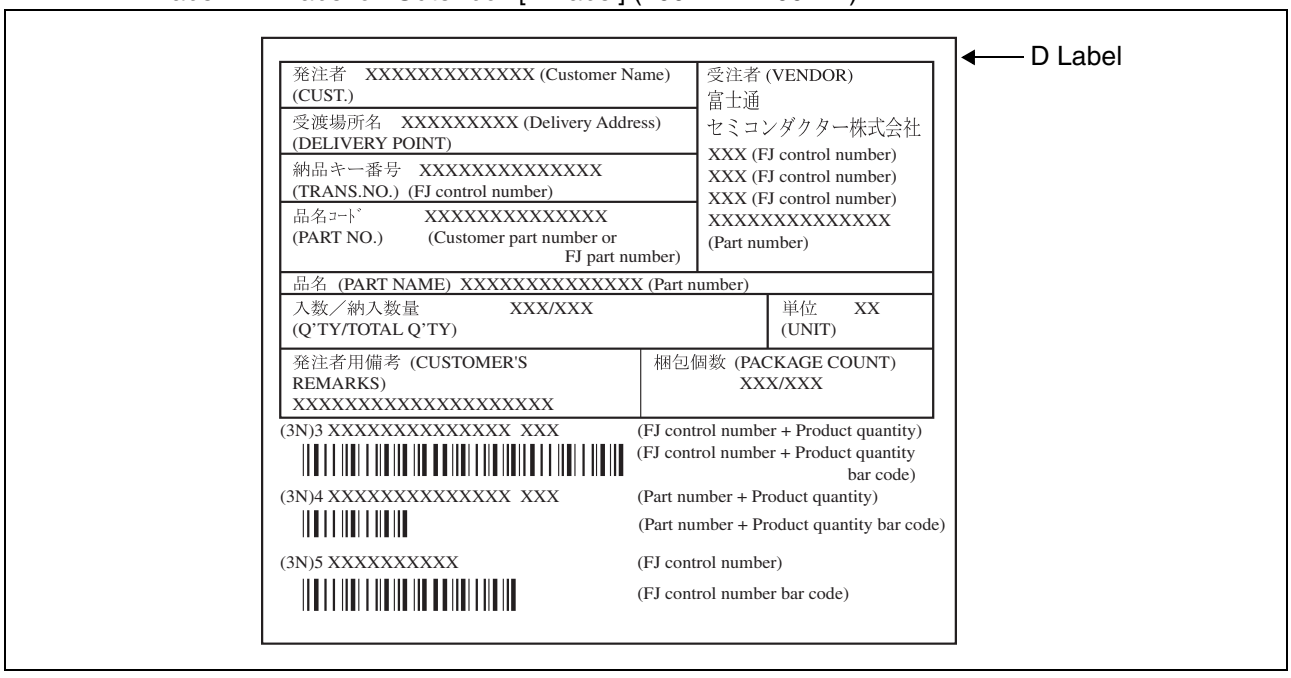
Note: The packing specifications may not be applied when the product is delivered via a distributer.

2.5 Product label indicators

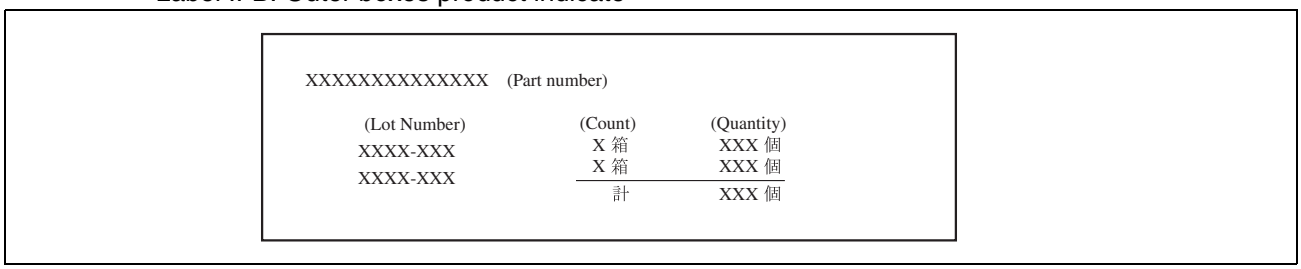
Label I: Label on Inner box/Moisture Barrier Bag/ (It sticks it on the reel for the emboss taping)
[C-3 Label (50mm × 100mm) Supplemental Label (20mm × 100mm)]



Label II-A: Label on Outer box [D Label] (100mm × 100mm)



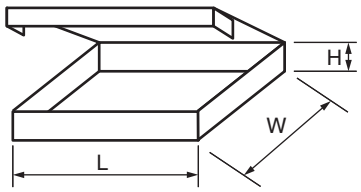
Label II-B: Outer boxes product indicate



Note: Depending on shipment state, “Label II-A” and “Label II-B” on the external boxes might not be printed.

2.6 Dimensions for Containers

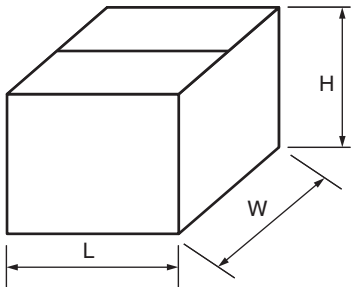
(1) Dimensions for inner box



Tape width	L	W	H
12, 16	365	345	40
24, 32			50
44			65
56			75

(Dimensions in mm)

(2) Dimensions for outer box



L	W	H
415	400	315

(Dimensions in mm)

■ MAJOR CHANGES IN THIS EDITION

A change on a page is indicated by a vertical line drawn on the left side of that page.

Page	Section	Change Results
—	—	PRELIMINARY → Data Sheet
1	■ DESCRIPTION	Revised the following description: The read/write endurance of the nonvolatile memory cells used for the MB85RC256V has improve to be at least 10^{10} cycles, → The read/write endurance of the nonvolatile memory cells used for the MB85RC256V has improve to be at least 10^{12} cycles,
	■ FEATURES • Read/write endurance	Revised the following description: 10^{10} times / byte → 10^{12} times / byte
	• Data retention	Revised the following description: 10 years (+70 °C) → 10 years (+85 °C)
13	■ ELECTRICAL CHARACTERISTICS 1. DC Characteristics	Revised the value of Operating power supply current: SCL = 400 kHz Max TBD → Max 170 (μA) SCL = 1000 kHz Max TBD → Max 250 (μA) Revised the value of Standby current: Typ TBD → Typ 27 (μA) Max TBD → Max 56 (μA)
16	■ FRAM CHARACTERISTICS	Revised the minimum value of Read/Write Endurance: 10^{10} Times/byte→ 10^{12} Times/byte Revised Operation ambient temperature of Data Retention: T_A = + 70 °C → T_A = + 85 °C
17	■ ESD AND LATCH-UP	Revised the value of Latch-Up (C-V Method) Proprietary method: "—" → ≤ |200 V|
21	■ ORDERING INFORMATION	Revised Minimum shipping quantity of MB85RC256VPF-G-JNERE2: TBD → "—"
